**Introduction:** Medical records are one of the units in each health facility and one of the units is diagnosis coding. At the Dinoyo Community Health Center, inaccurate diagnosis codes or incomplete diagnosis codes are often found and also the writing of the main diagnosis is often found to be incomplete and less specific, this is not in accordance with the rules in ICD 10. The aim of this research is to conduct an analysis of the relationship between the completeness of the writing of the main diagnosis with the accuracy of the diagnosis code at the Dinoyo Community Health Center. **Methode:** This research uses quantitative analysis and a cross-sectional approach, sampling using a non-probability sampling technique and an incidental sampling method using a sample of 90 DRM. **Result:** The research results found that 57.8% of diagnoses were not written completely and 70% of inaccurate diagnosis codes were recorded. The statistical test result is p=0.04 so H0 is rejected and Ha is accepted, so there is a relationship between the completeness of writing a diagnosis and the accuracy of the diagnosis code at the Dinoyo Community Health Center. **Conclusion:** The advice that can be given is that the writing of the diagnosis in the DRM is complete and specific, so good cooperation from the doctor is needed because the diagnosis is written by the doctor and the coding is carried out accurately and the coding is checked by the medical record officer.

Keywords: Medical Record , Complettnes of Diagnosis writing, Accuracy code
