School health efforts are an integrated cross-program and cross-sectoral effort to improve the ability to live healthy and then form healthy and clean living behaviors for students and school residents (Ministry of Health RI, 2011). This study aims to determine the effect of planning and organizing the UKS program on the attitudes of Tiwisada cadres in implementing the UKS TRIAS. This type of research is a quantitative study using the pre-experimental method with a one group pretest-posttest design. Research activities that provide initial tests (pre-test) before being given treatment and interactive quizzes, after being given treatment and interactive quizzes then provide a final test (posttest) as a measure of whether there is an increase in attitude. Based on the results of research on the effect of planning and organizing the UKS program on the attitudes of Tiwisada cadres in carrying out the UKS trias, it can be concluded. There is a significant difference in the knowledge value of Tiwisada cadres' attitudes before and after being given the intervention, with a pre-test score of 73.65 and a post-test score of 98.11.
