Non-communicable diseases are rather common in Indonesia. they are well-liked by the populace include diabetes mellitus, heart disease, cancer, obesity, and tuberculosis (Riskesdas 2018). The fact that only 38 individuals used the elderly healthcare each month, out of a total 160 individual in the village. This study aims to provide an overview of the elderly healthcare activities implemented for the elderly at Bunulrejo Village's, Malang City. The method used in this study is qualitative. Seven participants was participated in the study as informants four elderly healthcare cadres one health worker and two elderly participant. Techniques for gathering data include observation, documentation, and interviews. The study's findings demonstrate that the execution of elderly healthcare service activities is still not at its best. This is demonstrated by the low utilization rate of elderly healthcare for the elderly, incomplete elderly healthcare infrastructure, and non-implementation of health education for the elderly. The study concludes that in order to continue to gain benefit from the elderly healthcare's existence, community participation must be increased. Specifically, the elderly healthcare at Bunulrejo village is still not implemented adequately.
