

ABSTRACT

Wijaya, Firman Hadi (2026). *Nursing Care for Clients with CVA (Cerebral Vascular Accident) in the Flamboyant Ward of RSUD dr. Soedomo Trenggalek.* Scientific Paper. D3 Nursing Study Program, Trenggalek Campus, Department of Nursing, Health Polytechnic of the Ministry of Health Malang. Advisor: Ns. Edi Yuswantoro, S.Kep., M.Kep.

Background: Cerebral Vascular Accident (CVA) or stroke is a serious health problem and one of the leading causes of death and disability due to sudden disturbances in cerebral blood circulation. **Objective:** This study aims to provide nursing care and analyze the gap between theory and facts in clients with CVA in the Flamboyant Ward of RSUD dr. Soedomo Trenggalek. **Methods:** This research employed a qualitative descriptive method with a case study approach. Data collection was conducted through interviews, observation, physical examination, and documentation, followed by an analysis comparing theoretical standards with actual clinical conditions. **Results:** The assessment phase revealed limb weakness, decreased muscle strength, and speech impairment; however, not all assessment data were fully documented according to theoretical standards. Nursing diagnoses established included ineffective cerebral tissue perfusion, impaired physical mobility, and impaired verbal communication, though differences were noted in determining diagnostic priorities compared to the theory. Evaluation showed partial improvement after three days of care, but the results reached were not yet optimal according to the expected theoretical targets. **Conclusion:** This study emphasizes the importance of enhancing nursing competence in providing care for CVA patients to accelerate recovery and prevent complications.

Keywords: Nursing care, CVA, stroke.
